Abstract

People always buy many products without any previous intention and planning. This contributes to a large portion of income in many businesses around the world. There are many intrinsic and extrinsic factors that affect this unthoughtful and sudden buying decision. The aim of this research is to understand what internal and external elements have influence on impulsive buying behavior of adults in fashion industry in Tbilisi, Georgia. A mono-quantitative method, a questionnaire, has been used to collect the data from a sample of 385 adults in this study. The sampling technique used in this study is convenience sampling which was chosen mostly because of COVID19 (Corona virus disease in year 2019) pandemic situation. After finding the results and doing the analyses, it was concluded that demographic factors such as age, gender, and income together with the customer's personality type and fashion orientation affect impulsive buying decision. In addition, characteristics of the sales' agent, store design and atmosphere and discounts also affect the mentioned decision. When the person is a female and young, earns higher income per month, is fashion oriented and has an extrovert personality, the probability of impulsive buying decision increases. This probability will also increase if the store design is colorful and attractive, sales agent is helpful and informative, and there are discounts at store. As a result of this research, it is recommended to businesses to not only consider their customers demographic factors, but also to care about design of the store and train sales person to increase the probability of impulsive buying purchases by customers.

Key words: Impulsive buying, Fashion industry, Consumer behavior, Impulsive decision factors, Georgia, Tbilisi, Fashion orientation, Store design, Consumer decision making
