## Current Middle & Upper Palaeolithic Research in the Southern Caucasus

**Nicholaz Tushabramishvili, Daniel S. Adler, Ofer Bar-Yosef, and  
Anna Belfer-Cohen**

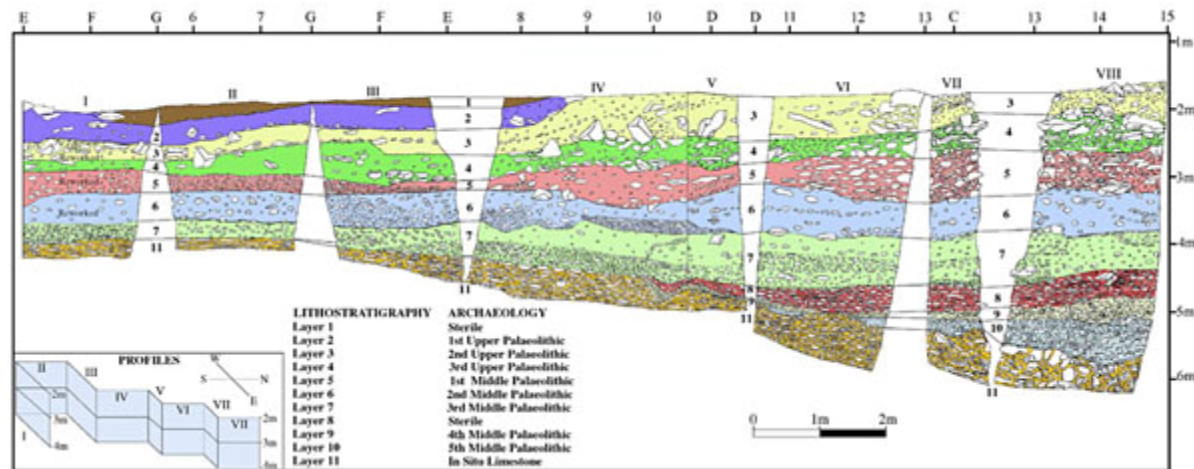

Previous research in the Georgian Republic, led to the identification of several distinct Middle Palaeolithic cultural variants based on perceived differences in lithic and faunal assemblages (Liubin 1977, 1989), but these groupings were developed without the benefit of reliable chronometric estimates. In addition, several important "transitional" assemblages from the region, now known to be the result of mixing, have led to the notion of a local transition from the Middle to the Upper Palaeolithic.

Ortvale Klde is a perfect setting in which to address these issues. Thus far we have completed the excavation of 6m<sup>2</sup> in the southern chamber. This work has led to the documentation and recovery of ~30,000 lithics, ~5,000 faunal remains, and numerous micromorphological and mineralogical samples, the systematic studies of which are ongoing. During the re-excavation of Ortvale Klde we identified five Middle and three Upper Palaeolithic layers (FIGURES 3 & 4). The Middle Palaeolithic layers (10-9 & 7-5) all contain lithic assemblages characterized as uni-directional Levallois industries dominated by scrapers with a high incidence of truncated faceting. Previous palaeontological analyses indicate that the faunal assemblage is dominated by *Capra caucasica* (~85%). Our ongoing zooarchaeological analysis is testing this claim while also investigating hunting

and faunal processing behaviours. The Upper Palaeolithic assemblages are dominated by small backed bladelets, endscrapers and several bone points, but they cannot be characterized as Aurignacian. Based on our current excavations no case can be made for a "transitional" industry at the site.

AMS, and TL estimates allow us to date the Middle Palaeolithic occupations to ~44-35ka (Layers 7-5). The older occupations in Layers 10-9 are currently being dated via TL, and Layer 8 is sterile. These same methods allow us to date the Upper Palaeolithic occupations (Layers 4-2) to ~32-21ka. These data suggest the persistence of Neanderthals in the region and the late arrival of Upper Palaeolithic peoples.

Based on our initial research at Ortvale Klde we believe that Neanderthals occupying the southern Caucasus were members of a larger prehistoric social and mating network demarcated by the Caucasus Mountains to the north and the Taurus-Zagros to the south (Adler & Tushabramishvili in press). Interactions with Neanderthal populations in the northern Caucasus are only suggested by a several finds from Mezmaiskaya Cave. It also appears that the southern Caucasus served as one of the last large territories occupied by Neanderthals. The abrupt shift from the Middle-Upper Palaeolithic at Ortvale Klde cannot be characterized as an in situ cultural

transition. Instead it appears Upper Palaeolithic peoples entered the region approximately 32ka without significant, if any, overlap with Neanderthal populations.

## Acknowledgements

Our research is supported by the Leakey Foundation; the American School for Prehistoric Research (Peabody Museum, Harvard University); the Mellon Foundation (Harvard University); the Davis Center for Russian Studies (Harvard University); and the Wenner-Gren Foundation for Anthropological Research (New York). Our thanks go out to our Georgian colleagues and we wish to recognize efforts of G. Bar-Oz, E. Boaretto, D. Lordkipanidze, N. Mercier, S. Weiner, and A. Smith.
